

## **Femoral Nerve Program Transcript**

This is a diagram of the femoral nerve, and you can see that it has branches from the spinal nerve going into the pelvis. So, if the spinal nerve is the site of lesion, then the muscles associated with the femoral nerve in the pelvis and in the anterior thigh are going to be affected. However, if the lesion is in the anterior thigh, then the muscles of the thigh and sensation to the thigh will be affected and not the muscles of the pelvis.
