

Pelvic Floor Dissection Program Transcript

This is a dissection of the lateral aspect of the pelvis showing the muscles in this region. At the top, you can see the piriformis and the nerves and arteries that cross it. Below that is the obturator internus. And then, to your left, is the pelvic diaphragm, beginning at the top with the coccygeus, then the iliococcygeus, and then the pubococcygeus and the puborectalis. Remember that the iliococcygeus, pubococcygeus, and puborectalis are part of the levator ani group.
