

## **Superficial Fibular Nerve Program Transcript**

This is a diagram of the superficial fibular nerve, which is a branch also off of the common fibular nerve. If the common fibular nerve is damaged, it will affect both the deep fibular nerve and the superficial fibular nerve. Damage to the superficial fibular nerve affects the muscles of the lateral compartment of the leg, as well as the sensation to the lateral leg and most of the top of the foot. Damage to the superficial fibular nerve at the ankle only affects the sensation to the dorsum of the foot.
