

## **Deep Fibular Nerve Program Transcript**

This is a diagram of the deep fibular nerve, which is a branch off the common fibular nerve, which is in the popliteal fossa. Damage to the common fibular nerve will also affect the deep fibular nerve. If the deep fibular nerve is damaged at the knee, it will affect muscles of the anterior compartment of the leg, as well as the muscles on the dorsum of the foot and the sensation between the big toe and the little toe. If the deep fibular nerve is damaged at the ankle, it will affect only muscles on the dorsum of the foot and the sensation to the area between the big toe and the little toe.
